

DYNASAFE Product Information MESC

MESC - Mobile Explosion Suppression Chamber

The **MESC** series of chambers is designed to suppress the effects from a suspected item, e.g. suspected suitcase recognized by x-ray at an airport, if detonating while waiting for EOD experts or during its removal to a safer location. As all Dynasafe "suppression" products the MESC provides protection against fragments and it also suppresses the effects from the blast wave.

The MESC is mainly designed for use at airports and other baggage handling systems (BHS) and it can be integrated with most existing systems.

The MESC is easily operated by one person. By pressing one button the MESC is automatically opened and the loading box is brought into position, ready to accept the suspected item(s).

In standard version the MESC can handle items as large as 1200 x 800 x 650 mm. By pressing the closing button the item(s) is automatically brought into the right position inside the MESC, the MESC continues the closing sequence and the surroundings are protected against a possible explosion.

The operating of the MESC may be done directly on the unit, remotely or if integrated with the BHS, from the BHS-control-panel. The unit is moved by hand or with external towing unit.
